# FoLiA: Format for Linguistic Annotation

Maarten van Gompel

24-03-2011

Introduction

#### Annotation formats in the field

- Many ad-hoc and old-style annotation formats (CGN, Tadpole column format)
- Many theoretic and specialised annotation formats with limited scope
- Overly rich document encoding formats (TEI)
- Many conversions needed
- De-facto-standards: SoNaR/D-COI and Alpino XML

### Limits Tadpole/Frog columned format

- Simplistic format, lacking expressiveness of XML
- Lacking expressiveness to fully represent Frog's results

Introduction

#### Limits of D-Coi

- Not expressive enough for many kinds of annotation (such as sense annotation, correction annotation, syntactic/dependency parses, etc..)
- Can't encode annotators
- Can't encode alternatives

Introduction

## Objectives (1/2)

### Objectives: Expressiveness, Extensibility, Uniformity

- One generalised rich common XML-based format, supporting almost all we do in TTNWW
- Uniform and consistent paradigm for annotations of various kinds
- Built from a bottom-up application-oriented perspective
- Not committing to any particular tagset or language
- Encoding many different annotation aspects simultaneously in a single XML file
- Support for sense annotation (DutchSemCor)

## **Objectives**

Introduction

### Objectives (2/2)

### Objectives: Expressiveness, Extensibility, Uniformity

- Support for complex corrections (Valkuil + Ticcl)
- Support for NER (HITIME)
- Support in Frog for reading and writing this format
- Based on the DCOI format (our de-facto standard)
- Inter-operability with ISO Data Category Registry
- Unicode compliant
- Fully open-source

### Annotations

## Supported Annotations (1/2)

FoLiA supports the following linguistic annotations:

- Part-of-Speech tags (with features)
- Lemmatisation
- Spelling corrections on both a tokenised as well as an untokenised level.
- Domain tagging
- Lexical semantic sense annotation (to be used in DutchSemCor)

Introduction

### Supported Annotations (2/2)

FoLiA supports the following linguistic annotations:

- Named Entities / Multi-word units
- Syntactic Parses
- Dependency Relations
- Chunking
- Corrections

More to be added when needed (in collaboration with partners)

Format

```
<?xml version="1.0" encoding="utf-8"?>
<FoLiA xmlns="http://ilk.uvt.nl/FoLiA"</pre>
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xml:id="example">
  <metadata>
    <annotations>
    </annotations>
    <!-- (Here IMDI or CMDI metadata can be inserted) --->
  </metadata>
  <text xml:id="example.text">
  </text>
</FoLiA>
```

- Unique identifier for document as a whole
- Metadata
  - Annotations Declaration of all used annotations
  - May hold IMDI or CMDI metadata
- Text

Format

```
<t>This is a test. It has two sentences.</t>
   <s xml:id="TEST.p.1.s.1">
       <t>This is a test .</t>
       <w xml:id="TEST.p.1.s.1.w.1"><t>This</t>/w>
       <w xml:id="TEST.p.1.s.1.w.2"><t>is</t>/w>
   </s><s xml:id="TEST.p.1.s.2">...</s>
```

Format

- **1 Structure Elements**: Paragraphs, Sentences, Words/Tokens
- More: Division, Head, List, ListItem, Figure, Gap...
- Unique identifiers (DCOI style by convention)
- Text element (t) holds actual text. May occur untokenised on higher levels as well.

## Paradigm: Annotation Categories

Three categories of annotation:

- Structure Annotation Elements denoting document structure
  - E.g. Divisions, Header, Paragraphs, Sentences, Lists, Figures, Gaps, Quote
- Token Annotation Linguistic Annotations pertaining to a single token (inline annotation)
  - E.g. Part of Speech Annotation, Lemma Annotation, Lexical Semantic Sense Annotation
- Span Annotation Linguistic Annotations spanning over multiple tokens (standoff annotation)
  - E.g. Syntactic Parses, Dependency Relation, Entities/Multi-word Units

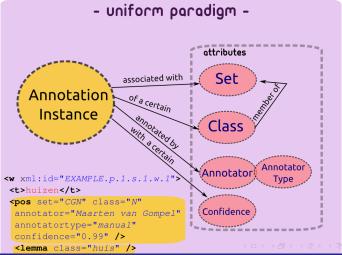

## Paradigm: Common Attributes

FoLiA Attributes common to the paradigm.

- **ID** A unique ID for the element
- Set Identifier of a particular (tag)set
- Class One class from the specified set
- **Annotator** An open identifier for the user/system who provided the annotation
- Annotator type "auto" or "manual"
- Confidence A confidence value between one and zero.
- **N** A sequential number (for numbered divisions/sections, list items, etc)

# Paradigm: Schematic

#### Token Annotation

Token annotation occurs within the scope of a word/token (w)element.

## Example

PoS and Lemma Annotation:

```
<w xml:id="example.p.1.s.1.w.2">
    <t>boot</t>
    <pos set="brown" class="n"</pre>
     annotator="Maarten,,van,,Gompel" annotatortype="manual"
    <lemma set="english-lemmas" class="boot" />
</w>
```

#### All annotations need to be declared in the metadata:

Default sets and annotator may be predefined at this level

## Example

```
<metadata>
<annotations>
  <token-annotation />
  <pos-annotation set="brown" annotator="MaartenuvanuGompel"
    annotatortype="manual"/>
  <lemma-annotation />
  </annotations>
</metadata>
```

## Alternative Token Annotations

Encodes mutually exclusive alternative annotations. Any annotations that are not alternatives are considered "selected".

```
<w xml:id="example.p.1.s.1.w.2">
    <t>bank</t>
    <sense set="wordnet3.0" class="bank%1:17:01:"</pre>
     annotator="Maarten_van_Gompel" annotatortype="manual"
     confidence="0.8">
     sloping ground near water/sense>
    <alt xml:id="example.p.1.s.1.w.2.alt.1">
     <sense set="wordnet3.0" class="bank%1:14:01:"</pre>
      annotator="WSDsystem" annotatortype="auto"
      confidence="0.6">
      financial institution</sense>
    </alt>
</w>
```

## Alternative Token Annotations

All token annotations grouped as one alternative are considered dependent. Multiple alternatives are always independent:

Annotations of the same type, but different sets need *not* be alternatives.

There can be only one of the same set though, this is illegal and requires usage of alternatives instead:

# Complex Token Annotations

Some annotation types are more complex, as they allow multiple classes, subclasses or classes with values. For example, Part-of-Speech annotation enriched with features:

```
<w xml:id="example.p.1.s.1.w.2">
    <t>boot</t>
    <pos set="cgn" class="N">
        <feat class="ntype" value="soort" />
        <feat class="number" value="ev" />
        <feat class="degree" value="basis" />
        <feat class="gender" value="zijd" />
        <feat class="case" value="stan" />
        </pos>
</ww>
```

- Token Annotation not sufficient, some annotations span over multiple tokens
- Spanning multiple tokens can produce nesting problems (e.g. A(BC)D and AB(CD)
- **Solution:** Span Annotation using standoff notation
- Applications: Syntactic Parses, Chunking, Dependency Relations, Entities/Multi-Word Units
- Layers: Each type of span annotation is placed within an annotation layer, annotation layers are embedded within sentences (s))
- Same paradigm: Set, class, annotator, confidence

```
<s xml:id="example.p.1.s.1">
  <t>The Dalai Lama greeted him.</t>
  <w xml:id="example.p.1.s.1.w.1">t>The</t></w>
  <w xml:id="example.p.1.s.1.w.2"><t>Dalai</t>/w>
  <w xml:id="example.p.1.s.1.w.3"><t>Lama</t>/w>
  < w \times m!:id = "example.p.1.s.1.w.4" > t>greeted < /t> /w>
  <w xml:id="example.p.1.s.1.w.5"><t>him</t></w>
  <w xml:id="example.p.1.s.1.w.6"><t>.</t>/w>
  <entities>
    <entity xml:id="example.p.1.s.1.entity.1" class="person">
        <wref xml:id="example.p.1.s.1.w.2" />
        <wref xml:id="example.p.1.s.1.w.3" />
    </entity>
 </entities>
</s>
```

```
<syntax>
<su xml:id="example.p.1.s.1.su.1" class="s">
  <su xml:id="example.p.1.s.1.su.1_1" class="np">
      <su xml:id="example.p.1.s.1.su.1_1_1" class="det">
         <wref xml:id="example.p.1.s.1.w.1" />
      </su>
      <su xml:id="example.p.1.s.1.su.1_1_2" class="pn">
         <wref xml:id="example.p.1.s.1.w.2" />
         <wref xml:id="example.p.1.s.1.w.3" />
      </su>
  </su>
</su>
<su xml:id="example.p.1.s.1.su.1_2" class="vp">
    <su xml:id="example.p.1.s.1.su.1_1_1" class="v">
        <wref xml:id="example.p.1.s.1.w.4" />
   </su>
    <su xml:id="example.p.1.s.1.su.1_1_2" class="pron">
      <wref xml:id="example.p.1.s.1.w.5" />
    </su>
 </su>
                                       ◆ロト ◆部 ト ◆ 恵 ト ◆ 恵 ・ 夕 Q ○
```

## Span Annotation: Alternatives

Q: How to encode alternatives?

A: Place the annotation layer within the altlayers element.

### Example

# Corrections

- Keeping track of corrections (spelling corrections, annotation corrections)
- Important principle: Identifiers **never** change.

# Corrections as Token Annotation (1/3)

```
<w xml:id="example.p.1.s.1.w.1">
    <t>tree</t>
    <pos class="n" />
    <correction xml:id="TEST-000000001.p.1.s.1.w.1.c.1">
        <new>
            <pos class="n" />
        </new>
        <original>
            <pos class="v" />
        </original>
    </correction>
</w>
```

```
<correction xml:id="TEST-000000001.p.1.s.1.w.1.c.2" class=</pre>
  annotator="Jane, Doe" annotatortype="manual" confidence="
    <new>
        <t>tree</t>
    </new>
    <original>
        <correction xml:id="TEST-000000001.p.1.s.1.w.1.c.1</pre>
            annotator="John Doe" annotatortype="manual" con
            <new>
                 <t>three</t>
            </new>
            <original>
                 <t>treee</t>
            </original>
        </correction>
    </original>
</correction>
                                     ◆ロト ◆団 ▶ ◆ 豆 ▶ ◆ 豆 ・ 夕 Q (*)
```

```
<s xml:id="example.p.1.s.1">
 <correction xml:id="example.p.1.s.1.c.1" class="merge">
    <new>
        <w xml:id="example.p.1.s.1.w.1-2">
            <t>online</t>
        </w>
    </new>
    <original>
        <w xml:id="example.p.1.s.1.w.1">
            <t>on</t>
        </w>
        <w xml:id="example.p.1.s.1.w.2">
            <t>line</t>
        </w>
    </original>
</correction>
</s>
                                        4 D > 4 B > 4 E > 4 E > -
```

```
<s xml:id="example.p.1.s.1">
<correction xml:id="example.p.1.s.1.c.1" class="split">
   <new>
       <w xml:id="example.p.1.s.1.w.1_1">
           <t>on</t>
       </w>
       <w xml:id="example.p.1.s.1.w.1_2">
           <t>line</t>
       </w>
   </new>
   <original>
       <w xml:id="example.p.1.s.1.w.1">
           <t>online</t>
       </w>
   </original>
</correction>
</s>
```

# Working with FoLiA: Querying with XPath

- XPath query for all paragraphs: /FoLiA/text//p
- XPath query for all sentences: /FoLiA/text//s[not(parent::s)]
- XPath guery for all words: /FoLiA/text//w[not(ancestor::original)]
- XPath guery for all words with lemma X: /FoLiA/text//w[not(ancestor::original)]/lemma[@class == "X"]
- XPath guery for the text of all words: /FoLiA/text//w[not(ancestor::original)]/t/child::text()

# Working with FoLiA: Python Library in PyNLPI

```
import pynlpl.formats.folia as folia
from fictional import lemmatise
doc = folia.Document(file="/path/to/folia/document.xml")
for word in doc.words():
    print "Word: " , str(word)
    print "PoS: " , word.select(AnnotationType.POS).cls
    if not word.has(AnnotationType.LEMMA):
        word.append( Lemma(cls=lemmatise( str(word) ),
        annotator="lemmatiserX", annotatortype=AnnotatorType.AUTO))
    print "Lemma: " , word.select(AnnotationType.LEMMA).cls
doc.save()
```

### Loose ends

- No format defined yet for definition of sets
- Links with ISO Data Category Registry.
- Validation (RelaxNG + Schematron)
- Inclusion of more annotation types
- Metadata, incorporation of CMDI

### **Future**

- libfolia: FoLiA C++ library
- FoLiA support in Frog
- Converters
- Visualisation

### Uniformity: generic framework with simple paradigm, XML based

- Expressiveness: Ability to encode many kinds of linguistic annotation, including structural annotation, alternatives, and corrections
- Expandibility: easy to add new annotations with the same paradigm
